Education

SRM University

Master of Computer Applications – CGPA: 8.08

June 2025 – July 2027

Chennai, Tamil Nadu

Gitam University

Bachelor of Science – Computer Science – CGPA: 7.43

June 2022 – March 2025

Visakhapatnam, Andhra Pradesh

Relevant Coursework

- Web Development
- Software Methodology
- Database Management
- Machine Learning
- Data Structures
- Artificial Intelligence
- Internet Technology
- Cloud Computing
- NLP

Technical Skills

Languages: Python, HTML/CSS, JavaScript, SQL

Developer Tools: VS Code, Git/GitHub, Jupyter Notebook, Microsoft Excel

Technologies/Frameworks: Flask, Node.js, Pandas, NumPy, Scikit-learn, TensorFlow, MySQL, REST APIs

Projects

ML Model for Botnet Attack Detection | Python, Flask, Scikit-Learn, MySQL | GitHub Repo: [Click Me](#) **April 2025**

- Designed and implemented a hybrid machine learning-based botnet detection system to identify malicious activities in Android-based IoT environments using behavioral and network traffic analysis.
- Integrated multiple machine learning models including Random Forest, Decision Tree, SVM, XGBoost, and hybrid combinations to improve detection accuracy and reduce false positives.
- Developed a Flask-based web application with secure user authentication and MySQL database integration for real-time botnet prediction and result management.

TruthLens: AI Powered Fake News Detector | Python, Scikit-Learn, JavaScript | GitHub Repo: [Click Me](#) **October 2025**

- Built an end-to-end NLP web application that detects fabricated news articles with 98.6% accuracy using a Logistic Regression model trained on a 40,000 article dataset.
- Developed a Flask REST API to handle real-time text processing (cleaning, TF-IDF vectorization) and model inference.
- Designed a responsive, dynamic frontend using HTML/CSS/JS to interact with the API and display real-time confidence scores and predictions cleanly to the user.

Smart AI Travel Planner | Python, Flask, JavaScript, HTML/CSS, Mapbox API | GitHub Repo: [Click Me](#) **March 2026**

- Built a full-stack dashboard utilizing REST APIs (OpenWeather, Mapbox Directions, Wikipedia) to provide real-time weather and automatic landmark search for dynamic travel routes.
- Programmed an interactive JavaScript map that automatically retrieves geospatial coordinates and visualizes turn-by-turn driving paths between global cities.
- Engineered a resilient Python backend with automated error-handling and data fallbacks to ensure the UI remains fully functional even during API rate-limit events.

Certifications

Excel: Mother of Business Intelligence – CodeBasics.io

Foundations of Cybersecurity – Google

Data Mining – Coursera
